Abstract:

The content of the abstract must include 1. the Background: Describe the background: question, and goals. These three pieces of information form the backbone of your research project. In four to five sentences, give the background for your research, state the question you're trying to answer with that research, and then define the goal of your study. Here's an example: Everyone has had the experience of getting caught in the rain. But why does it rain? My intuition is that by analyzing barometer data, I will be able to determine the likelihood that it will rain on any given day. This simple example makes it easy to see the critical details: There's background (rain), a question (why?), and a goal (figuring out the likelihood of rain). 2. The Method: Define your methodology. Methods come next — this is where you detail in brief the research methods. In the example above, the person writing the paper is going to use a barometer to try and predict the likelihood of rain. Go into additional detail about exactly how you intend to use your methodology to collect data. 3. The Sample: The sample was selected for the current study (If your paper is a *concept paper*; not applicable). 4. The Results: Summarize your findings: Write out your main findings in your abstract in one to two sentences. This part is simple: Summarize what you found with your research project. In the rain example, you simply say if there was any correlation between the occurrence of rain and the barometric pressure. 5. Conclusion: Explain the significance: This section is where you tell your audience why your research matters. This is the money maker, where you illustrate why your findings are important and why people should read your full paper. An example of significance might be: We can measure the likelihood of rainfall based on barometric pressure. Now you have all the tools you need to write an abstract for your research paper. Read on to learn how to make your hard work look as professional as possible.
